Your SEEK Story Framework

Use this section to build the narrative context for a learning project. SEEK grounds your learner in meaning before asking for effort.

The Story Foundation

16. What is the name of your learning project — course, program, training, coaching relationship, or curriculum?

~~Week 3 Expedition Report: The Civic Archive Mix-Up~~

17. Who is the central character of this story? (The learner themselves, a fictional user, a professional persona, etc.)

An is a signal analyst from the Kairova Archive District. An is good at recognizing patterns and seeing in dark places, but always carries a broken scanner and makes jokes when nervous.

18. What challenge or problem does this character face at the beginning? Be specific and vivid.

An enters the Civic Archive Dome and discovers that hundreds of entry records have been duplicated. The broken scanner keeps giving confusing results, and the archive's bright emergency lights interfere with An's night vision.

19. What does the world look like once this character has successfully completed the learning journey?

The false records are removed, the original records are protected, and the archive system works normally again. An also leaves clear instructions so the next crew can avoid the same problem.

The Narrative Arc

20. Write a 2-3 sentence story opener you could use to begin your course, session, program, or module. Make it personal and specific.

An entered the Civic Archive Dome expecting a simple inspection. Instead, the system showed hundreds of visitors entering at the exact same time, and An's broken scanner proudly announced, "Everyone is authorized!"

21. How will you weave this story throughout the material? Describe 2-3 places where the narrative will resurface.

The story begins with An discovering the duplicated records. It continues when An uses pattern recognition and night vision to find the source of the problem. It ends when An removes the false copies, repairs the system, and leaves instructions for the next crew.

Designing Your AAA Sequence

Use this section to map AAA at both scales: the full experience and the next lesson.

Name of Experience / Module / Pipeline:

Week 3 Expedition Report: The Civic Archive Mix-Up

Stage 1: Application

7. What real thing will the learner touch, test, make, or play with immediately?

The learner immediately opens and tests a four-scene expedition report in a browser. They use Previous and Next, inspect the images and text, and confirm that the story changes one scene at a time.

8. What productive friction do you want them to encounter here? What misconception should fail safely?

The first version may show missing images, hidden scenes, or buttons that do not move correctly. The safe misconception to challenge is that code works just because it looks correct in VS Code; browser testing reveals what must be fixed.

Stage 2: Action

9. What are the 3-5 core concepts, definitions, or moves that should arrive only after Stage 1?

Semantic HTML for four scenes; CSS for a readable comedy atmosphere and active states; JavaScript for Previous/Next controls; relative image paths and alt text; Git commits, testing, and GitHub Pages publishing.

10. How will the learner use those ideas to refine what they already began?

The learner replaces sample content with An's story, adds one image per scene, styles the report, and connects the controls. After each small change, they save, refresh, test all four scenes, check the console, and revise the failing part.

Stage 3: Amplification

11. What bigger frameworks, professional practices, or collaborative contexts will open here?

This opens professional practices such as accessible web design, iterative debugging, peer testing, version control, and publishing a site for an outside reader. Feedback becomes evidence for the next improvement.

12. How does AAA work at the macro scale of the full experience and at the micro scale of one lesson or node?

At the macro scale, Application begins with building the report, Action introduces HTML/CSS/JavaScript techniques, and Amplification adds testing, collaboration, Git, and publication. At the micro scale, each lesson starts with a concrete task, adds one concept, then asks the learner to apply and verify it.
